High fidelity prototype/presentation feedback

Positives
- Prototype was very data-driven (API endpoints to support each statistic included in the dashboard)
- Clean design
- The settings are straightforward and easy to use

Negatives
- Problems with the sidebar as there already is a sidebar in Canvas and will not integrate with Canvas well.
- Did not make many major updates in transitioning to the prototype from the low fidelity prototype
- Did not integrate some changes from previous client meeting
- Did not implement discussion board metrics which were discussed during the previous client meeting, for example: contributions to discussion board, discussion board metrics and number of replies etc.

Reflection
- Sidebar: confusion between our team and the clients as the application is supposed to be embedded within a Canvas page. Therefore, there wouldn't be a clash between the Canvas sidebar and the analytics dashboard sidebar.
- Did not change many things from the low fidelity prototype: clients seemed to be happy with the overall design and layout of the original low fidelity prototype. Based on our meeting minutes, the main feedback was based on small changes to certain areas of the dashboard - some of these were integrated. The features that were discussed with the clients as a "possible feature" did not end up being possible. This did not seem to be understood by the clients.
